## GENERAL DESCRIPTION

This portion of this township subdivided by me is mountainous; the mountains are high and steep and covered nearly entirely with heavy growth of fir timber of poor quality, being much of it unsound and thickly set with limbs which extend nearly to the ground. On the ridges are found laurel and chinquapin.

Practically all over the surface there is a dense undergrowth, consisting of salal, huckleberry, rhododendron, vine maple and Oregon grape.

The geological formation consists of sandstone overlaid with sandy soil; the stone crumbles when exposed to the air, and would seem to be of no commercial value.
