CHAINS

The elevations range from about 800 feet above sea level along the South Fork of Deer Creek, to about 2,000 feet above sea level at the Standard Corner of sections 34 and 35.

Access to the area is gained by way of South Fork of Deer Creek Road.

The area is drained by tributaries of the South Fork of Deer Creek. The soil is a clay loam. The land has, to a large extent, been cleared in the past and is used mainly for pasture for cattle and sheep. There is a good stand of second growth fir and hemlock in the forested areas with scattered cedar, alder, maple and dogwood. The undergrowth is composed of Oregon grape, fern, grass, salal, poison oak, and hazel.

There were no active mineral claims noted in the area.

The average of a number of observations made through-out the area gives a value of $18^{\circ} 45'$ E. for the mean magnetic declination. There is a range of $\frac{1}{2}^{\circ}$ in local attraction.
