

10325

Dependent Resurvey, Portion of Subdivisional Lines,
T. 32 S., R. 6 W., Willamette Meridian, Oregon

CHAINS

Land, mountainous.
Soil, rocky clay.
Timber, fir, pine, cedar, hemlock, yew, oak, maple, chinquapin, alder, and madrone; undergrowth, poison oak, huckleberry, ceanothus, manzanita, salal, Oregon grape, and fir reproduction.

GENERAL DESCRIPTION

The area covered by this resurvey is located about four miles north of Glendale, Oregon. The area is drained by Windy Creek, Wood Creek, McCullough Creek, and their tributaries flowing in a southerly direction. Access is by way of several dirt roads extending through privately owned land along Windy Creek and McCullough Creek.

The area is mountainous, with elevations ranging from about 1570 feet above sea level at the corner of sections 22, 23, 26, and 27, to about 3200 feet above sea level near the $\frac{1}{4}$ section corner of sections 20 and 21.

The soil in the area is composed mainly of clay, with rock outcroppings at higher elevations. Timber consists primarily of fir with stands of pine, cedar, hemlock, yew, oak, madrone, chinquapin, maple, and alder. Undergrowth is poison oak, salal, huckleberry, ceanothus, manzanita, wild rose, arrowwod, Oregon grape, and fir, pine, hemlock, and oak reproduction.

There were no mineral deposits noted along the lines surveyed; however, mining claims are now being located in section 17.

The average of a considerable number of readings throughout the area gives a value of 20° E. for the mean magnetic declination. There is a range of 2° due to local attraction.
